

Title: Sound Absorption Test Results

Product: Blaffe

Material: 1/2" PET Felt

Testing Standard: ASTM C423 (J Mount)

About This Test: This test evaluates the effectiveness of a product to absorb sounds at multiple frequencies when suspended in a hanging baffle or cloud configuration. Results are presented in Sabins, a unit of absorption commonly used for spaced suspended products.

Test Result Summary: NRC - 1.05; SAA - 1.05

NRC	SAA
1.05	1.05

Frequency (Hz)	Absorption Coefficient
100	0.08
125	0.16
160	0.21
200	0.37
250	0.48
315	0.62
400	0.73
500	0.84
630	0.95
800	1.11
1000	1.23
1250	1.35
1600	1.48
2000	1.65
2500	1.80
3150	1.85
4000	1.89
5000	1.91

Test Date: 12/21/2022

Test ID: RAL-A22-513

MATERIAL LOGIQ TESTING DISCLAIMER

MATERIAL LOGIQ makes every effort to ensure the accuracy and reliability of the information provided. Laboratory testing is conducted by independent testing organizations. MATERIAL LOGIQ does not guarantee that field tests or independent tests will not vary. Acoustical Surfaces is a sister company of MATERIAL LOGIQ and is listed as the Manufacturer within the test report. The product referenced within the test report is the same MATERIAL LOGIQ product listed on this test coversheet.

TEST METHODOLOGY

Riverbank Acoustical Laboratories™ is accredited by the U.S. Department of Commerce, National Institute of Standards and Technology (NIST) under the National Voluntary Laboratory Accreditation Program (NVLAP) as an ISO 17025:2017 Laboratory (NVLAP Lab Code: 100227-0) and for this test procedure. The test reported in this document conformed explicitly with ASTM C423-22: "Standard Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method." The specimen mounting was performed according to ASTM E795-16: "Standard Practices for Mounting Test Specimens During Sound Absorption Tests." A description of the measurement procedure and room specifications are available upon request. The results presented in this report apply to the sample as received from the test sponsor.

INFORMATION PROVIDED BY SPONSOR

The test specimen was designated by the sponsor as PET Felt 4'x4' Baffle. The following nominal product information was provided by the sponsor prior to testing. The accuracy of such sponsor-provided information can affect the validity of the test results.

Product Under Test

Product Name: PET Fiber 4' by 4' Baffle Unit
Core Material: PET Fiber
Core Nominal Thickness: ½"
Core Nominal Density: 12.5 lb pcf
Tile/Panel Dimensions: 48" by 48"
Manufacturer: ASI

Acoustical Surfaces Inc.

SPECIMEN MEASUREMENTS & TEST CONDITIONS

Through a full external visual inspection performed on the test specimen, Riverbank personnel verified the following information:

Test Specimen

Product Type: Four (4) baffle clouds
Materials: PET felt, 8 felt fins per cloud held together by 2 base pieces
Dimensions: 32 fins @ 273 mm (10.75 in.) by 1207 mm (47.5 in.)
8 base pieces @ 152 mm (6 in.) by 1207 mm (47.5 in.)
Felt Thickness: 12.15 mm (0.4785 in.)
Overall Weight: 25.06 kg (55.25 lbs)

Physical Measurements (per object)

Dimensions: 1.21 m (47.5 in) wide by 1.21 m (47.5 in) long
Thickness: 0.29 m (11.5 in)
Weight: 6.27 kg (13.81 lbs)

Test Environment

Room Volume: 291.98 m³
Temperature: 20.0 °C ± 0.1 °C (Requirement: ≥ 10 °C and ≤ 5 °C change)
Relative Humidity: 62.75 % ± 1.5 % (Requirement: ≥ 40 % and ≤ 5 % change)
Barometric Pressure: 100.2 kPa (Requirement not defined)

The array of objects covered 5.82 m² (62.7 ft²) of the horizontal test surface (total treated area).

MOUNTING METHOD

Type J Mounting: The specimen is an array of 4 sound absorbing baffle clouds placed over cables such that the closest face is located approximately 1441 mm (56.75 in.) from the horizontal test surface. This approximates the mounting method of a typical ceiling baffle installation. The objects were distributed in two rows of two, with the cloud edges butted together.

Appendix D to ASTM C423 Sound Absorption Test

Non-standard calculation of equivalent NRC Rating and Absorption Coefficients from spaced absorbers

At this time, ASTM C423 does not provide a standard method for determining absorption coefficients of spaced object absorbers. Tests of a set of sound absorbing objects spaced apart from each other will yield higher absorption rates than a specimen joined together as a single patch (A-Mount or E-Mount). For this reason it is unfair to provide NRC or absorption coefficient ratings for specimens that consist of a spaced set of absorbers. Despite this, the architectural industry has expressed great demand for a simple "single number" rating for these treatments. Likewise, acoustical consultants desire equivalent absorption coefficient data for use in acoustical modeling software. The following is an attempt to appease these demands until ASTM develops a standard method for calculation. Several alternate non-standard calculation methods are provided. Riverbank Acoustical Laboratories prefers method 1. Rating titles for these methods are prepended with the word "Apparent". These rating names and their associated acronyms are provided by RAL and shall not be misconstrued as originating from any current standard.

Method 1) Apparent Sound Absorption Coefficient calculated from extended test specimen envelope

The total sound absorption yielded by the specimen is divided by the surface area of the test surface covered by the suspended objects, including intermediate spaces, with additional added area to allow theoretical extrapolation for larger arrays. This method is not applicable in this case due to the tessellating design of the baffle clouds. Apparent sound absorption coefficients, and subsequently the Apparent Noise Reduction Coefficient (A*NRC) and Apparent Sound Absorption Average (A*SAA) ratings, are calculated using this surface area based on the methods described in ASTM C423-22. This may be the most accurate method for comparing object arrays to ceiling tile products. The apparent sound absorption coefficient data can be assigned to a single horizontal surface or plane in acoustical modeling software for approximation of object array performance. Such approximations rely on the assumptions that object spacing is similar to that of the tested array across the entire surface, that gaps are negligibly small between adjacent rows of objects if the test specimen consists of a single row, and that the installation occurs over a perfectly reflective surface material.

Method 2) Apparent Sound Absorption Coefficient calculated from total exposed surface area of specimen

The total sound absorption yielded by the specimen is divided by the total surface area of all exposed specimen faces. This method is not applicable in this case. Apparent sound absorption coefficients, and subsequently the Apparent Noise Reduction Coefficient (A*NRC) and Apparent Sound Absorption Average (A*SAA) ratings, are calculated using this surface area based on the methods described in ASTM C423-22. This method shows the actual absorption occurring at the exposed surfaces but does not provide a fair comparison with materials mounted as a uniform patch (in A-mount or E-mount).

Appendix D (continued)

Method 3) Apparent Sound Absorption Coefficient calculated from one face per object

The total sound absorption yielded by the specimen is divided by the surface area of one side of one large face for each object in the specimen. This method is not applicable in this case. Apparent sound absorption coefficients, and subsequently the Apparent Noise Reduction Coefficient (A*NRC) and Apparent Sound Absorption Average (A*SAA) ratings, are calculated using this surface area based on the methods described in ASTM C423-22. This method is favored by some material manufacturers since it yields very high NRC figures, but does not provide a fair comparison with other ceiling tile or wall panel products. Riverbank Acoustical Laboratories recommends that results obtained from this method be used for research and comparison purposes only; such results should not be used for marketed claims of product performance.

Method 4) Apparent Sound Absorption Coefficient calculated from specimen envelope without extension

The total sound absorption yielded by the specimen is divided by the rectangular test surface area covered by the suspended objects, including intermediate spaces. The object rigging covered 5.82 m² (62.7 ft²) of horizontal test surface area. Apparent sound absorption coefficients, and subsequently the Apparent Noise Reduction Coefficient (A*NRC) and Apparent Sound Absorption Average (A*SAA) ratings, are calculated using this surface area based on the methods described in ASTM C423-22. While similar in concept to Method 1, attempting to model any array larger than the tested specimen using these results would imply instances of adjacent objects with zero spacing scattered throughout the extrapolated array. Riverbank Acoustical Laboratories recommends that results obtained from this method be used for research and comparison purposes only; such results should not be used for marketed claims of product performance.
